Species Description

The Eastern Ribbonsnake is a long, slender, semi-aquatic snake (up to 70 cm). It is jet-black with three yellow stripes running from head to tail along its back and sides; it has a caramel brown shade on the lower sides, and a white tear-drop scale in front of each eye. It is a harmless snake, and it is not venomous. In fact, NONE of the snakes found in Atlantic Canada are venomous!

Distinguishing features:
Vertical white bar in front of each eye, solid yellow stripes (on 3rd and 4th scale row up from the belly).

Occurs throughout southwest Nova Scotia, with known concentrations in Kejimikujik and on Molega Lake.

Habitat

In the summer, found in freshwater wetlands (stillwater streams, marshes, swamps, bogs) and lakeshores. During this time they are rarely observed more than 30 m from the water's edge in areas with aquatic vegetation, shallow pools, and amphibians. Winter habitats are not well known but some snakes may overwinter a considerable distance from water in the forest.

Eastern Ribbonsnakes are typically found near water (wetlands, lakeshores) in the summer. They are semi-aquatic and swim well. They are thought to spend the winter and spring in upland forested habitats.

Interesting Points

- Females are ovoviparous (they give birth to live young) and are typically bigger than males.
- Snakes do not have eyelids! They have a transparent scale (spectacle) that covers each eye. It appears cloudy just before snakes shed their skin.
- Ribbonsnakes eat mostly small fish and amphibians.

Cloudy scale over the eye (about to shed skin!)

Similar Species

There are five snake species that live in Nova Scotia (remember, none are venomous): Smooth Green Snake, Ring-necked Snake, Red-bellied Snake, Maritime Garter Snake and the Eastern Ribbonsnake. The garter looks the most similar to the ribbonsnake and has many different colourations.

Maritime Garter Snake: (both photos)

Bigger; diamond-shaped head; various colours; checkered patterning; no vertical white bar in front of each eye; paler stripe along the 2nd and 3rd scale rows, usually without the caramel coloring below it.

Threats to Survival

- Intentional harm by humans.
- Road mortality.
- Habitat loss and shoreline development.
- Mortality caused by pets (especially cats).
- Lack of knowledge (which limits our ability to know how to help this species).

How You Can Help

Learn about snakes and tell your friends and family they are harmless. Reduce vehicle mortality by watching for snakes on roads and trails. Keep domesticated pets from disturbing or harming snakes. Maintain the natural vegetation around lakeshore and wetlands on your property. Report sightings!
